2.86.0

Upcoming Change Details		
Version	2.86.0	
Change Type	☐ *Breaking change* ☑ *Bug Fix* ☑ *New Feature* ☑ *Enhancement*	
Change Details	*Fixes*	• Shift Patterns page does not crash when editing shift patterns with unset break configuration, days of the week, flags, loading duration or week index values. • Bulk Order Upload no longer occasionally halts.
	Features	• New Orders Reporting page has been added. This page provides valuable data for monthly operational reports, including a bar chart breakdown of completed orders by delivery status (e.g., on time, late, or skipped). • Orders Reporting page has been extended to include more comprehensive data for monthly operational reports. This now encompasses the number of scheduled, unscheduled, and canceled orders, alongside various depot-aggregated statistics such as active vehicles, utilized shifts, average activities per vehicle, total shift time used, jobs per hour, and total distance traveled. • Orders Reporting page provides means to export the report in a CSV file. • Orders Moving functionality now allows partial movement. When partial movement mode is enabled via toggle, orders that cannot be placed on the target trip will be moved to 'unscheduled', allowing to complete as much of the action as possible without manually retrying.
	Enhancements	• slots-api schedule amend endpoint has been updated to support additional modes. These new modes prevent the creation of unscheduled orders, causing the operation to fail gracefully when conditions are not met. This update is backwards compatible: if the new

		parameter is not defined, the system defaults to the existing behavior. Please refer to the API documentation for more information.
		• Schedule page performance improvements when loading trip list.
